AS a creator
I WANT to make slideshows/compilations based on lyrics
So THAT I can entertain in a visually pleasing way

In order for the app to work, two backend API's will be used throughout; **Pexels,** and **Lyrics.ovh**
As well as the inclusion of **Animate.css** as the frontend API.

The way the app will function is by using *Lyrics.ovh* to fetch the lyrics of a song of a users choice, then for each word in the song, use *Pexels* to get an image of the sung word and display it in corresponding order. We can also go a step further and save the user's inputs using *localdata* so that they can see their past creations, and have their most recent creation displayed as they load onto the webpage.
